

\negthinspace

This command produces a negative kern whose width is one-sixth of an em (p. ‘dimdefs’), i.e., it causes T_EX to move its position left by that amount. It is useful for bringing together characters that are a little too far apart. T_EX won’t break a line at a **\negthinspace**.

Example:

The horror, the horror\negthinspace, the horror of it all!

produces:

The horror, the horror, the horror of it all!
