These commands produce the symbols for various binary operations. Binary operations are one of T_EX's classes of math symbols. T_EX puts different amounts of space around different classes of math symbols. When T_EX needs to break a line of text within a math formula, it will consider placing the break after a binary operation—but only if the operation is at the outermost level of the formula, i.e., not enclosed in a group.

In addition to these commands, T_EX also treats ‘+’ and ‘−’ as binary operations. It considers ‘/’ to be an ordinary symbol, despite the fact that mathematically it is a binary operation, because it looks better with less space around it.

Example:

```

$$z = x \div y \quad \text{if and only if} \quad z \times y = x \text{ and } y \neq 0$$

```

produces:

$$z = x \div y \quad \text{if and only if} \quad z \times y = x \text{ and } y \neq 0$$
