

**\limits**

In text style, T<sub>E</sub>X normally places limits after a large operator. This command tells T<sub>E</sub>X to place limits above and below a large operator rather than after it.

If you specify more than one of `\limits`, `\nolimits`, and `\displaylimits`, the last command rules.

*Example:*

Suppose that `\bigcap\limits_{i=1}^N q_i` contains at least two elements.

*produces:*

Suppose that  $\bigcap_{i=1}^N q_i$  contains at least two elements.
