

```

\textstyle
\scriptstyle
\scriptscriptstyle
\displaystyle

```

These commands override the normal style and hence the font that T<sub>E</sub>X uses in setting a formula. Like font-setting commands such as `\it`, they are in effect until the end of the group containing them. They are useful when T<sub>E</sub>X's choice of style is inappropriate for the formula you happen to be setting.

*Example:*

```
$t+{\scriptstyle t} + {\scriptscriptstyle t}$
```

*produces:*

$$t + t + t$$
