

`\mathaccent` $\langle mathcode \rangle$

This command tells T_EX to typeset a math accent whose family and character code are given by $\langle mathcode \rangle$. (T_EX ignores the class of the `mathcode`.) See Appendix G of *The T_EXbook* for the details of how T_EX positions such an accent. The usual way to use `\mathaccent` is to put it in a macro definition that gives a name to a math accent.

Example:

```
\def\acute{\mathaccent "7013}
```
