

`\skew`  $\langle number \rangle$   $\langle argument_1 \rangle$   $\langle argument_2 \rangle$

This command shifts the accent  $\langle argument_1 \rangle$  by  $\langle number \rangle$  mathematical units to the right of its normal position with respect to  $\langle argument_2 \rangle$ . The most common use of this command is for modifying the position of an accent that's over another accent.

*Example:*

```

$$\begin{aligned} & \text{\texttt{\$}\skew 2\bar{\bar z}\text{\texttt{\quad}}\skew 3\tilde{\tilde y}\text{\texttt{\quad}} \\ & \text{\texttt{\skew 4}\tilde{\hat x}\text{\texttt{\$}}} \end{aligned}$$

```

*produces:*

$$\bar{\bar{z}} \quad \tilde{\tilde{y}} \quad \tilde{\hat{x}}$$
