1

\splitfirstmark \splitbotmark

These commands expand to the mark text generated by an earlier $\mbox{\sc mark}$ command that produced an item in the item list of a vbox V. The mark text has the form of a token list. When TEX splits V in response to a $\mbox{\sc vsplit}$ command (p. '\vsplit'), it sets the values of these commands as follows:

- \splitfirstmark contains the tokens of the first mark in the item list of V.
- \splitbotmark contains the tokens of the last mark in the item list of V.

These commands produce no tokens if there was no preceding \vsplit, or if the most recent preceding \vsplit didn't contain any marks.
