```
\baselineskip [\langle glue \rangle parameter] \lineskiplimit [\langle dimen \rangle parameter] \lineskip [\langle glue \rangle parameter]
```

These three parameters jointly determine how much space TEX leaves between consecutive boxes of an ordinary vertical list, e.g., the lines of a paragraph. This space is called "interline glue". It is also inserted between the component boxes of a vbox constructed in internal vertical mode.

In the usual case, when the boxes aren't abnormally high or deep, TEX makes the distance from the baseline of one box to the baseline of the next one equal to \baselineskip. It does this by inserting interline glue equal to \baselineskip minus the depth of the upper box (as given by \prevdepth) and the height of the lower box. But if this interline glue would be less than \lineskiplimit, indicating that the two boxes are too close together, TEX inserts the \lineskip glue instead. See pages 79–80 of The TEXbook for a precise description.

Note that \baselineskip and \lineskip measure different things: the distance between baselines on the one hand and the distance between the bottom of one box and the top of the next box on the other hand. See page 78 of The TEXbook for further details. The first example below shows the effects of \lineskiplimit.

You can obtain the effect of double spacing by doubling the value of \baselineskip as illustrated in the second example below. A change to \baselineskip at any point before the end of a paragraph affects the entire paragraph.

 $^{^1}$ TeX actually accounts for the beginning of a vertical list by setting \prevdepth to $-1000\,\mathrm{pt}$ and testing \prevdepth before every box. If \prevdepth $\leq -1000\,\mathrm{pt}$ it does not insert any interline glue.

 $\mathbf{2}$

Example:

\baselineskip = 11pt \lineskiplimit = 1pt \lineskip = 2pt plus .5pt Sometimes you'll need to typeset a paragraph that has tall material, such as a mathematical formula, embedded within it. An example of such a formula is \$n \choose k\$. Note the extra space above and below this line as compared with the other lines.

(If the formula didn't project below the line, we'd only get extra space above the line.)

produces:

Sometimes you'll need to typeset a paragraph that has tall material, such as a mathematical formula, embedded within it. An example of such a formula is $\binom{n}{k}$. Note the extra space above and below this line as compared with the other lines. (If the formula didn't project below the line, we'd only get extra space above the line.)

Example:

\baselineskip = 2\baselineskip % Start double spacing.
