							1
B	$\infty$	\infty	3	\exists	$\partial$	\partial	_
	$\Re$	∖Re	$\forall$	\forall		\surd	
	$\Im$	\Im	$\hbar$	\hbar	60	\wp	
	7	\angle	$\ell$	\ell	b	\flat	
	$\triangle$	\triangle	×	\aleph	#	\sharp	
	\	\backslash	$\imath$	\imath	Ц	\natural	
	1	\vert	J	\jmath	4	\clubsuit	
		\	$\nabla$	\nabla	$\Diamond$	\diamondsuit	
	Ï	\Vert	$\neg$	\neg	$\Diamond$	\heartsuit	
	Ø	\emptyset	$\neg$	\lnot		\spadesuit	
	$\perp$	\bot	′	' (apostrophe)			
	Т	\top	1	\prime			

These commands produce various symbols. They are called "ordinary symbols" to distinguish them from other classes of symbols such as relations. You can only use an ordinary symbol within a math formula, so if you need an ordinary symbol within ordinary text you must enclose it in dollar signs (\$).

The commands  $\$  and  $\$  imath are useful when you need to put an accent on top of an 'i' or a 'j'.

An apostrophe (') is a short way of writing a superscript \prime. (The \prime command by itself generates a big ugly prime.)

The \| and \Vert commands are synonymous, as are the \neg and \lnot commands. The \vert command produces the same result as '|'.

The symbols produced by \backslash, \vert, and \Vert are delimiters. These symbols can be produced in larger sizes by using \bigm et al. (p. '\bigm').

## Example:

The Knave of  $\Lambda$  stole some tarts. produces:

The Knave of  $\heartsuit$ s, he stole some tarts.

## Example:

If \$\hat\imath < \hat\jmath\$ then \$i' \leq j^\prime\$.
produces:</pre>

If  $\hat{\imath} < \hat{\jmath}$  then  $i' \leq j'$ .

## Example:

$$\frac{x-a}{x+a} \setminus \frac{y-b}{y+b}$$
