1

```
\textstyle
\scriptstyle
\scriptscriptstyle
\displaystyle
```
These commands override the normal style and hence the font that TₑX uses in setting a formula. Like font-setting commands such as \it, they are in effect until the end of the group containing them. They are useful when TₑX's choice of style is inappropriate for the formula you happen to be setting.

Example:
```
$t+{\scriptstyle t + {\scriptscriptstyle t}}$
```
produces:

$t + {\scriptstyle t + {\scriptscriptstyle t}}$
